# PRODUCTION ✦ SELECTOR

Configure workflows 'on the fly' for creative software applications

Central management of workstations

Dramatically increase workstation utilisation

Reduce downtime and system deployment

Enables DR solutions to become a reality

Easy creation of custom workflows

Conflicting apps can run on the same workstation

Supports multiple versions of the same app

Monitor system usage

Avid Interplay & ISIS/NEXIS workgroups

Control Windows services

Modify Windows registry

Control all running apps

Modify app configurations

Manage files & folders

Map network resources

Install fonts

PRODUCTION SELECTOR

Configure workflows 'on the fly' for creative software applications

PRODUCTION SELECTOR

Now at version 3 and successfully deployed with major US & UK broadcasters, Production Selector is a software configuration tool that allows simple and complete control over workflows across multiple workstations. This includes Avid Interplay, ISIS/NEXIS, Media Composer, Pro Tools, Adobe, EVS, Quantel and many other creative systems.

BENEFITS

- Huge financial savings on support resources with centralised system administration and no longer requiring "on site" or "in suite" support for productions.

- Save valuable production time – Select a production and immediately start working. Essential for organisations with large freelance workforces.

- Increase resource utilisation by allowing multiple productions to share the same resources.

- Control failover from one system or workflow to another, maintaining business continuity and making sure you don't miss a deadline or interrupt your live service.

- Automate workflows by replacing manual processes with integrated application automation and create your own custom workflows.

- Monitor your system and receive alerts to any issues or changes before they become a major problem.

SIMPLE USER INTERFACE

With a single mouse click, a user can be connected and logged into an Avid Interplay system, have their production's shared folders mounted and their asset management application launched, ready to start working.

Then, with just a single mouse click, that same workstation can be instantly re-configured to work with a completely different system.

SYSTEM ADMINISTRATION

From a system administrator's perspective, Production Selector has centrally managed powerful controls that ensure that the required services and configurations are automatically loaded without any user intervention.

This ensures multi-use workstations can be flexibly and accurately set up without the requirement for support personnel. It also means new or replacement workstations do not require time consuming configuration before they are deployed.

ACTIVITY LOG

Production Selector centrally logs all its activity so it's easy to monitor what is going on. It is possible to track system usage by programme type or client for billing purposes or flag any errors in the system so that they can be quickly resolved.

LICENCING

Licencing is available to suit most requirements. Production Selector consists of a number of optional components:

- Client Software – licenced per client either with a perpetual licence or on an annual basis.
  Quantity and site discounts are available.

- Professional Services for the initial consultation, configuration & installation.

- On Site Training in administration, configuration and user acceptance.

- On-going support tailored to suit your needs with regular software updates.

COMPATIBILITY

Microsoft Windows 7, 8 & 10
Microsoft Windows Server 2008, 2012 & 2016
Apple Mac version coming soon
